Left Ventricular Myocardial Noncompaction in a Child Affected by Cri Du Chat Syndrome

Marcello Marci, MD & Lucrezia Lo Cascio, MD

Keywords: echocardiography, Cri du chat syndrome, left ventricular noncompaction, atrial septal defect, noncompaction cardiomyopathy

Abstract

The following is a case report of an infant born with Cri du chat syndrome that has evidence of left ventricular noncompaction.

Cri du chat syndrome is a rare association of growth retardation, severe intellectual disability, hypertelorism and typical catlike cry, often combined with congenital heart defect, the occurrence of myocardial noncompaction among the associated cardiac anomalies has not been reported so far.

Introduction

Cri du chat syndrome is a congenital disease with a characteristic cry, psychomotor delay, growth retardation and facial dysmorphism, resulting from deletion of the short arm of chromosome 5, first described by Lejeune et al. in 1963.¹

We report the case of a three-year-old male affected by this syndrome, who developed left ventricular noncompaction, a rare myocardial disorder that is the third most frequent cause of cardiomyopathy in childhood. Isolated left ventricular noncompaction is a congenital anomaly of myocardium characterized by prominent trabeculations consistent with myocardial meshwork with deep recesses, more evident in the lateral wall and apex of the left ventricle.

It has been hypothesized that myocardial noncompaction could be determined by failure of the process of trabecular compaction of the spongy meshwork of fibers, between gestational weeks 20 and 26, and the intertrabecular recesses become capillaries. Left ventricle noncompaction is characterized by the echocardiographic appearance of a non-compact subendocardial layer, which is two-fold thicker than the outer compact myocardial layer, in the parasternal short-axis. Moreover, there are deep inter-trabecular recesses perfused from the ventricular cavity.

This cardiomyopathy can have a wide spectrum of clinical manifestations ranging from asymptomatic cases to heart failure, thromboembolic events, malignant arrhythmias, and sudden death, especially in patients with left ventricular dilatation. In childhood, cardiac insufficiency usually manifests with failure to thrive and respiratory symptoms. To the best of our knowledge, this is the first time that association of Cri du chat syndrome with left ventricular noncompaction is reported in literature.

Case Presentation

The patient was the second child of non-consanguineous, healthy parents; his sister was also healthy. He was born at 39 weeks after an uncomplicated pregnancy. He showed a weight of 2,840 grams, ear malformations, bilateral single transverse palmar crease, microcephaly, systolic murmur and a cat-like cry. On the basis of dysmorphic facial appearance and atypical cry, Cri du chat syndrome was diagnosed, confirmed by karyotype 46 XX with 5p -; array CGH showed 5p15.33p14.3 deletion.

He was referred to our department for a systolic murmur. The echocardiogram showed a small secundum-type atrial septal defect and a slight prominent trabeculation that required an echographic follow-up. At the age of three-years-old, the echocardiogram was consistent with noncompaction of left ventricular apex and lateral distal wall, with a non-compacted/compacted myocardium ratio of 2:1 or more, and intertrabecular recesses filled by colour Doppler flow. Internal ventricular diameters were normal and systolic function was preserved (fractional shortening >30% and ejection fraction =55%) (**Figure 1**). At the one year follow-up, the ejection fraction is still normal, and the baby does not have symptoms of heart failure nor arrhythmias.

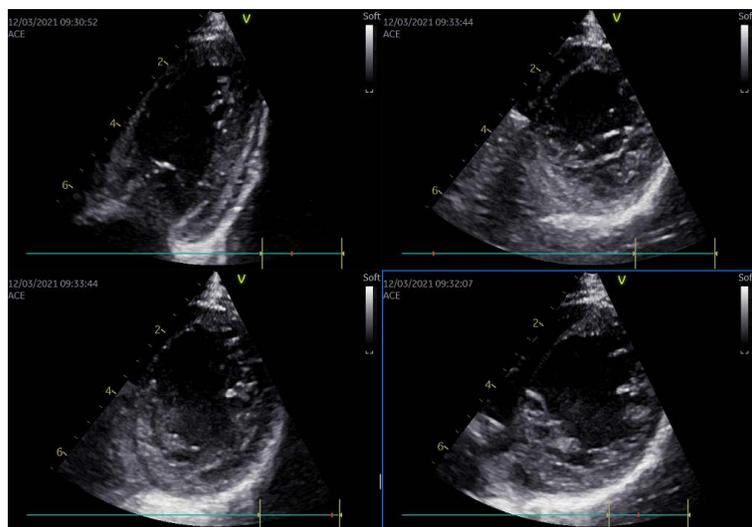

FIGURE 1 Apical and parasternal short axis views of the left ventricle.

Discussion

Cri du chat (OMIM 123450) is a chromosomal syndrome, resulting from partial deletion on the short arm of chromosome 5, that is characterized by severe mental delay, cat-like cry, microcephaly, and facial abnormalities.

Congenital cardiac malformations are observed in about 29% of patients with microdeletion and in 55% of individuals affected by balanced translocation. The most frequent cardiac lesions are patent ductus arteriosus and ventricular septal defects; occasionally, it is associated with ventricular outflow obstruction.² Several contiguous genes mapped in 5p have been associated with cardiac development, such as ADAMTS16 in the region 5p15.32, DNah5, NDUFS6 and IRX4 in region 5p15.33.^{2,3,4}

Left ventricular noncompaction has not been reported in children with Cri du chat syndrome so far. Isolated myocardial noncompaction has a heterogeneous etiology, with sporadic or familial incidence.⁶ In about one third of patients with left ventricular noncompaction, a genetic cause can

be detected, mostly an autosomal dominant inherited mutation of several genes, such as TAZ, Cypher/ZASP, FKBP12, CSX, mitochondrial and sarcomeric protein genes can be involved too.⁶ An X-linked inheritance has been reported in 7% of the patients⁶ with frequent deletion of G4.5 gene, mapped in the long arm of the X chromosome. Noncompaction of the left ventricular myocardium can occur in association with neuromuscular disorders and genetic syndromes such as deletion 22q11, monosomy X (Turner syndrome), and Trisomy 13 and 18.

Among many of the genes identified as responsible for the development of myocardial noncompaction, some authors have focused attention on Nkx2-5, a critical component of the cardiac gene regulatory network. Left ventricular noncompaction has been reported in children with a mutation of Nkx2-5 and in Nkx2-5 knockout mice.⁷ Nkx2-5 transcription factor regulates many key aspects of heart development in concert with other cardiac transcription factors, particularly Irx4. In fact, mice lacking the homeobox transcription factor Nkx2-5 have markedly reduced levels of Irx4 protein in cardiomyocytes.

Recent studies have identified Irx4, belonging to the Iroquois family of transcription factor, as a possible candidate in left ventricular noncompaction development.⁵ Interestingly, transgenic mice lacking Irx4 develop myocardial noncompaction and have thinner ventricular walls with excessive trabeculations.⁵ In addition, Irx4-deficient mice exhibit increased expression of heart failure marker Brain Natriuretic Peptide and develop cardiomyopathy with impaired systolic function and myocardial hypertrophy.

As a matter of fact, Irx4 expressed only in the trabecular region of myocardium during all stages of cardiac development⁸ is essential for the process of transformation of trabecular in compact myocardium.⁵ Irx transcription factors specifically inhibit expression of Bmp10, one of the NOTCH1 associated molecules involved in myocardial hyper-trabeculation.⁵⁻⁹ Notably, our patient carried a deleted region containing the Irx4 gene (5p 15.33, position1,877,413-1,877,236) thus suggesting that haploinsufficiency of this transcription factor can lead to noncompaction phenotype.

Conclusion

We described the unprecedented reported case of Cri du chat syndrome associated with left ventricle noncompaction; the child carried a deletion of 5p 15.33 containing the Irx4 gene, that plays a pivotal role in ventricular myocardium development. Myocardial noncompaction, which is an evolutionary disorder, was not detectable at the first cardiologic evaluation of our patient, and gradually manifested at annual echocardiographic follow-up. Due to the variable latency of clinical manifestations of this cardiomyopathy, a complete cardiologic evaluation is suggested at the neonatal age in every patient with Cri du chat syndrome and should be screened periodically with echocardiography and ultrasounds beyond the neonatal age to rule out any cardiomyopathy.

Since severe outcomes and major cardiac adverse events have been frequently observed in patients with left ventricular noncompaction associated with chromosomal abnormalities,¹⁰ an early diagnosis of this cardiomyopathic condition and periodic follow-ups are essential in order to monitor cardiac complications, particularly potential malignant rhythm alterations.

Conflict of Interest

The author has none to report. This research received no specific grant from any funding agency, commercial or not-for-profit sectors.

**Nicklaus
Children's
Hospital**

Heart Institute

Outstanding Opportunity for a BC/BE Pediatric Cardiac Intensivist in Miami

The Heart Institute at Nicklaus Children's Hospital, a 309-bed freestanding children's hospital, and Nicklaus Children's Pediatric Specialists, the physician multispecialty group practice of Nicklaus Children's Health System, have an exceptional opportunity for a BC/BE pediatric cardiac intensivist.

Our Cardiac Intensive Care Unit (CICU) was the first in the Southeast and provides care for newborns and children receiving treatment for congenital heart defects. With a longstanding tradition of excellence, our cardiac critical care team is currently comprised of six full-time attending physicians and six full-time nurse practitioners. We have an illustrious cardiology fellowship and have offered advanced training in cardiac critical care medicine for more than 20 years. The desired candidates should be board certified or eligible in pediatric critical care medicine or pediatric cardiology. Preference will be given to individuals with dual training in pediatric critical care and cardiology or those board eligible in either cardiology or pediatric critical care who have completed a minimum of one year of advanced training in cardiac intensive care medicine. Applicants should exhibit a strong interest in clinical care, education and academics. Nicklaus Children's Hospital is an affiliate of the Florida International University Herbert Wertheim College of Medicine. Candidates possessing all levels of experience shall be considered.

Our state-of-the-art Advanced Pediatric Care Pavilion houses a 34-bed cardiac in-patient unit with an adjustable acuity model that allows all rooms to accommodate critically ill patients with heart disease. The Heart Institute offers a full range of services, including the management of patients following congenital heart surgery, interventional catheterization and invasive electrophysiology. Our cardiac surgical program, led by Dr. Redmond Burke, is one of the most transparent in the world. It remains the only cardiovascular surgical program to offer real-time outcomes reporting (<https://rto.nicklauschildrens.org>).

Founded in 1950, the rebranded Nicklaus Children's Hospital is renowned for excellence in all aspects of pediatric medicine and has numerous subspecialty programs that are ranked among the best in the nation. It is also home to the largest pediatric teaching program in the southeastern U.S. Our organization consistently appears on employer award lists such as Fortune magazine's "Best Workplaces In Health Care," Becker's "150 Great Places to Work in Healthcare" and People magazine's "50 Companies That Care." Join a phenomenal team that brings lifelong health and hope to children and their families through innovative and compassionate care.

The Heart Institute at Nicklaus Children's, a world leader in pediatric cardiology and cardiovascular surgery for the care of children with congenital heart disease, serves as a beacon to families confronting the reality of a child or newborn with a heart defect.

Competitive compensation and benefits package.

The Congenital Heart Collaborative | University Hospitals
Rainbow Babies & Children's
Nationwide Children's Hospital

Pediatric Cardiologist Rainbow Babies and Children's Hospital

Rainbow Babies and Children's Hospital (RBC) and The Congenital Heart Collaborative (TCHC) are conducting a search to identify candidates for an additional Pediatric Cardiologist to join our expanding program.

Opportunity Highlights:

- The position will predominantly serve as the primary Pediatric Cardiology representative to our MetroHealth partnership, an innovate affiliation between Rainbow and the MetroHealth System to provide world class pediatric cardiology care in downtown Cleveland, with options to serve additional clinics at our main Rainbow campus and other ambulatory locations across Northeast Ohio.
- Coverage at MetroHealth will include inpatient consultation of the Neonatal ICU, Pediatric ICU, and general pediatric unit.
- The RBC Heart Center provides comprehensive services across all cardiac subspecialties and includes 21 faculty (12 cardiologists, 5 cardiac intensivists, 2 cardiothoracic surgeons, and 2 cardiac anesthesiologists) along with a full complement of interdisciplinary team members.
- **RBC Heart Center and Nationwide Children's Hospital Heart Center in Columbus, OH have partnered to form The Congenital Heart Collaborative (TCHC).** TCHC is a dedicated service line with a common executive administration and functions as one program on two campuses with the commitment to expand access to high-quality comprehensive cardiac care regardless of patient age to the communities served while equally embracing a scholarly and educational mission.
- RBC Heart Center has an ACGME accredited Pediatric Cardiology fellowship with two fellows per year.
- The facilities at the RBC Heart Center include a recently opened, state-of-the-art Interventional Cath/EP/Hybrid OR suite and a beautiful, dedicated cardiac stepdown unit. Planning is underway for a new state-of-the-art Pediatric Cardiac Intensive Care Unit that will be immediately adjacent to the Hybrid Cath/EP suites and stepdown unit with plans for opening in 2023.
- Faculty at RBC maintain an academic affiliation with Case Western Reserve University with an academic portfolio that allows for promotion and career advancement.
- Based on the experience and interest of the successful candidate, research support and/or support for quality improvement work is readily available.

Opportunity Highlights:

- Candidates will be considered at any academic rank, including fellows completing training.
- Must have completed a 3-year pediatric cardiology fellowship and be BC/BE in Pediatric Cardiology.
- Must be eligible for medical licensure in Ohio.

For more details about this opportunity and/or to apply,
please contact Ira Cheifetz, MD, Chief, Cardiology and Cardiac Critical Care at
Ira.Cheifetz@UHhospitals.org.

University Hospitals is an AA/EOE/ADA employer committed to excellence through diversity.

Utility of 3D Printing in Neonatal Mitral Valve Repair: A Case Report

Donald J. Mattia, MD; Jonathan D. Plasencia, PhD; Daniel A. Velez, MD; Wayne J. Franklin, MD; Christopher L. Lindblade, MD

Keywords: Congenital Heart Disease, imaging, mitral regurgitation, mitral valve repair, pediatric, preoperative care

Case

A full-term newborn female failed her Congenital Heart Disease screen and echocardiogram revealed severely dysplastic mitral valve leaflets (anterior leaflet thickened with rolled tips, P1-P2 scalloped with nearly fixed mobility, P2 thickened with cleft), resulting in mitral regurgitation (MR) and severe left atrial enlargement (**Figure 1A**). On the second Day of Life, she developed cardiogenic shock secondary to poor cardiac output that resulted in necrotizing enterocolitis and multi-organ system failure. She was intubated, started on milrinone and epinephrine, and transferred to a tertiary center.

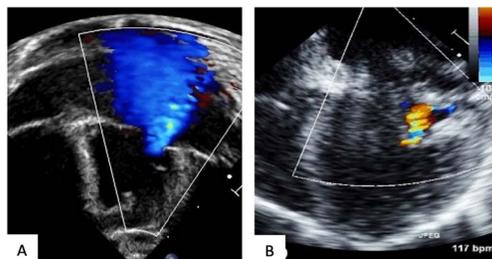

FIGURE 1
A). Transesophageal echocardiogram, mid-esophageal view demonstrating severe preoperative mitral regurgitation.
B). Transesophageal echocardiogram showing trivial mitral regurgitation postoperatively.

Computed-tomographic angiography (CTA) highlighted severely aneurysmal left atrium (LA) spanning over 41 cm craniocaudally, with signs of bilateral ventricular volume overload (**Figure 2A, 2B**). Echocardiogram demonstrated a dilated mitral valve annulus (2.07 cm, PHN z-score +9.6). Treatment options including medical management, transcatheter valve implantation, and surgical mitral valve repair were considered. A multidisciplinary

team assessed the case and ultimately preferred surgical repair circumventing the need for a prosthetic valve and the need for anticoagulation. Echo and CT 3D reconstruction was limited in determining feasibility of surgical repair because the degree of atrial dilatation distorted typical landmarks and rotated the axis of the heart superiorly and rightward. Additionally, surgical planning required improved visualization of the pulmonary venous connection to the LA to determine the extent of left atrial wall resection.

Therefore, 3D printing of the myocardium was performed to provide a more thorough anatomical assessment (**Figure 3**). This modality has been utilized for its improved pulmonary vein evaluation in other procedures involving intricate LA manipulation, including left atrial appendage closure and radiofrequency ablation planning.^{1,2} The 3D print allowed the surgical team to determine a safe approach via Sondergaard's groove as well as a region for tissue excision that would maintain the integrity of the pulmonary venous insertion.

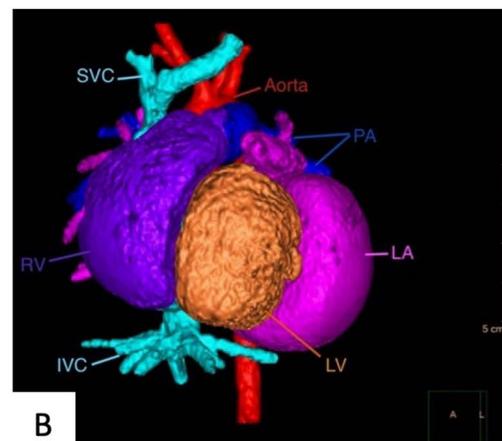

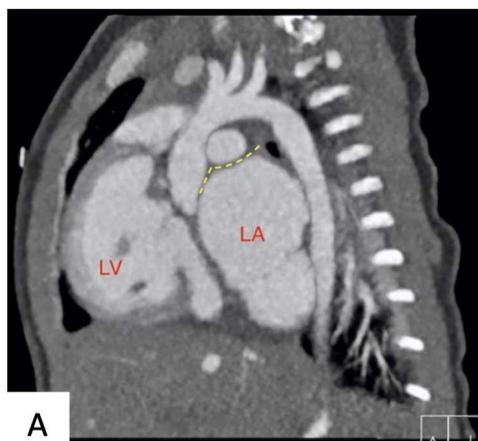

FIGURE 2
A). CTA, sagittal view. Dotted line demonstrates surgical approach via Sondergaard's groove in order to manipulate the mitral valve.
B). Labeled CTA 3D reconstruction.

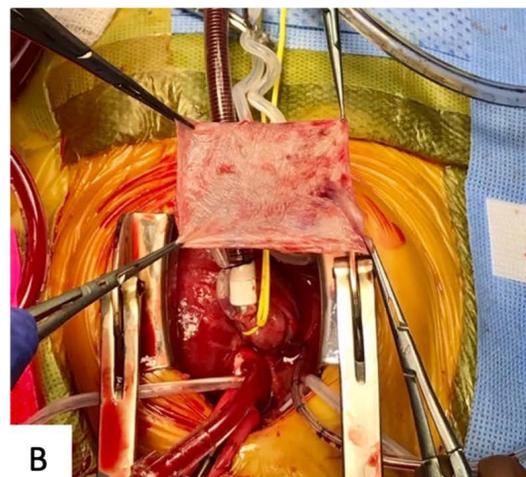

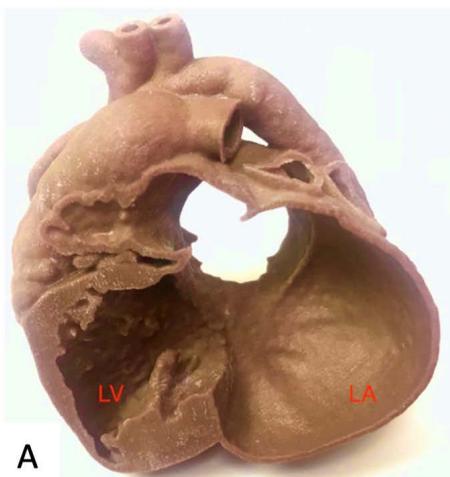

FIGURE 3
A). 3D print of myocardium, sagittal view. **B).** Resected left atrium tissue.

After extensive examination of the 3-D print, surgical mitral valve repair and commissuroplasty of both lateral and medial commissures and cleft closure on both leaflets was performed at 42 Days of Life. Utilizing the knowledge of the posterior left atrial wall anatomic landmarks obtained from examination of the 3-D print, extensive reduction atrioplasty was performed, and the LA closed in two layers. The excised LA tissue spanned an area of 4 x 5 cm. Intraoperative transesophageal echocardiogram demonstrated successful repair of the mitral valve with significant improvement of mitral regurgitation from severe to trivial (**Figure 1B**).

Mitral valve repair can be challenging because of both the unique pathologic morphology of a dysplastic mitral valve as well as the limited ability to visualize the anatomy by standard echocardiography.³ Preoperative 3D-echocardiography is routinely performed in most congenital surgical centers to assess the entire mitral valve complex.⁴ Typically, CTA is generally preferred to visualize the great vessels, coronary arteries, and extracardiac structures. However, our case demonstrates the role for CTA with 3D printing for improved evaluation of left atrial landmarks and mitral valve morphology to assist with the intricacies of surgical planning.

Transplant Cardiologist with an Interest in Rehabilitation Science

We are seeking a Board Eligible/Board Certified Pediatric Cardiologist with formal 4th year training in Cardiomyopathy, Ventricular Assist Device, and Cardiac Transplantation for a faculty position at the Cincinnati Children's Hospital Medical Center.

The Advanced Cardiomyopathy Program works closely within the Heart Institute, caring for patients with the most challenging conditions, and has been the largest pediatric heart transplant program in the Tri-State area for the last decade. Expertise includes heart, heart-liver, heart-lung, and heart-kidney transplantation. The prospective faculty member will be expected to excel in academic endeavors, have clinical and academic focus in Cardiac Transplantation, and have interests in Cardiopulmonary Exercise Testing and Cardiac Rehabilitation.

Leaders in Pediatric Heart Transplant

The Heart Transplant Program, part of the interdisciplinary Heart Institute, is the oldest pediatric heart transplant program in Ohio. We are part of the Heart Institute's combined program linking cardiomyopathy/heart failure and mechanical circulatory support care.

Our team of cardiothoracic surgeons, cardiologists, nurse practitioners, and nurses are experts in the treatment of complex heart disease and [heart transplantation](#). We care for infants, children, adolescents, and adults with uncorrectable congenital heart disease and [cardiomyopathy](#), facilitating their candidacy for transplantation, and delivering their post-transplant care.

Our heart transplant program is approved by the United Network for Organ Sharing (UNOS) and a member of the Ohio Solid Organ Transplantation Consortium. In addition, our transplant team members are participants in the Pediatric Heart Transplant Study and the International Society for Heart and Lung Transplantation.

Our goal is to provide children facing untreatable heart disease the best chance to be active members of their families and communities, and the best chance to grow emotionally and physically with as little limitation as possible. Our areas of emphasis include:

- Care provided by a multidisciplinary team of cardiologists, surgeons, intensive care specialists, nurse practitioners, and nurses.
- Outcomes-focused clinical care and research to optimize survival and quality of life.
- Quality initiatives, such as prevention of rejection and use of cutting-edge technologies to detect for harmful antibodies and detect for transplant coronary artery disease.

Our clinical team's extensive experience and our commitment to long-term quality outcomes form the foundation of the Heart Transplant Program.

Interested candidates should apply to this position through Cincinnati Children's Career page: <https://jobs.cincinnatichildrens.org/>. Enter Requisition # 129989 in the box provided and attach your CV, cover letter of interest and three references to your online application.

U.S. News & World Report scored our [Joint Heart Program](#), in conjunction with Kentucky Children's Hospital, on outcomes & experience; numbers of patients & procedures; key programs, services & staff; professional recognition; quality improvement efforts; and patient support.

PICS Symposium 2022 – Welcome Back!

Kamel Shibbani, MD

For this month's column, we recently had a conversation with PICS Symposium Founder Dr. Ziyad Hijazi and current Program Director Dr. Damien Kenny about the upcoming Symposium in Chicago from September 7th – 10th, 2022.

KS: Thank you both! Let's jump right in – what is the theme of this year's meeting?

D.K: The core sentiment of this year's meeting is all of us getting back together again and bringing back a sense of normalcy. Although we were together last year, many friends and colleagues were unable to attend due to the pandemic. We are very optimistic that this year we will return to business as usual and able to share our experiences together in a safe and reasonably unrestrictive way.

KS: Last year PICS adopted a hybrid approach allowing participation both virtually and in person. What should we expect this year?

DK: We very much hope this year's meeting will be back to a full in-person meeting. The pandemic has shown us the feasibility of having speakers join virtually, especially those unable to travel. But we're hopeful that such instances will be the exception rather than the rule.

KS: Can we expect a virtual component for participants, where cases and talks can be taped and reviewed offline for those unable to attend in person?

DK: To a very limited degree. A select number of the presentations will be recorded and made available on the members-only part of our website. This is important so that selected talks about fundamentals or major advances in our field can be disseminated to our entire community.

However, the bedrock of the annual PICS Symposium has been in-person dialogue. Consistently, the feedback we get highlights this as the most critical component of the meeting. That is the core reason our community's once-a-year "come together" is so special!

"The bedrock of the annual PICS Symposium has been in-person dialogue. [...] That is the core reason our community's once-a-year 'come together' is so special!" – Dr. Damien Kenny

KS: Live cases are always a popular component of the meeting. Can you tell us a where we'll be broadcasting from for this year for the live cases?

DK: Chicago historically has had several different centers providing congenital cardiac services and we thought it would be ideal to include all three centers. All three of them graciously accepted. That speaks to the sort of collaboration that we would like to highlight between various congenital cardiac services. So, we'll have live cases from Lurie Children's Hospital, Christ Advocate Medical Center, and Rush University Medical Center.

Our first day is usually our international day, and we're hoping to have teams from Cairo, Toronto, as well as teams from Sidra in Qatar.

ZH: Actually, this will be the first time in 25 years that Cairo will transmit to us live! Dr. Maiy El Sayed will be joining us for live cases this year. We are honored to have Dr. El Sayed and her team playing such an important role!

DK: I think that's a great reflection on how far things have come in Egypt, thanks mainly to the great work they do.

ZH: We also have colleagues joining us from the US for live cases.

DK: Yes! Our other live cases will be from Nationwide, Denver, and Mayo Clinic.

KS: In addition to live cases from new international sites, can we expect new presenters as well?

DK: Certainly! We're constantly looking to add to our faculty. We have a "Young Leadership Award" each year, and the winner automatically joins the PICS faculty. In addition, we're having a session about new technology that will bring new faces from the FDA to share their experiences. Reflecting on feedback from last year, we have expanded faculty slots to include younger colleagues who are doing excellent work, ensuring they have an opportunity to showcase this great work.

KS: I understand that this year's meeting will highlight the role of lymphatics in Congenital Heart Disease.

DK: We're going to have a three-hour dedicated session about lymphatics which will involve Dr. Yoav Dori as well as other international experts including Dr. Petru Liuba from Sweden. This session will include a taped case and possibly a hands-on lymphatics workshop at the beginning of the meeting! Stay tuned for confirmation of the hands-on lymphatic workshop, this would be a great opportunity to learn the techniques needed to access the lymphatic system. Exciting new direction for our field!

KS: That sounds wonderful! Are there any other hands-on activities planned, either in the animal lab or otherwise?

DK: We're going to have a three-hour dedicated session about lymphatics which will involve Dr. Yoav Dori as well as other international experts

including Dr. Petru Liuba from Sweden. This session will include a taped case and possibly a hands-on lymphatics workshop at the beginning of the meeting! Stay tuned for confirmation of the hands-on lymphatic workshop, this would be a great opportunity to learn the techniques needed to access the lymphatic system. Exciting new direction for our field!

KS: Can you tell us some more about the Fellows and Early Career course?

DK: We're excited to offer that course again this year! The plan is to have it over the two days prior to the meeting. It'll run on Monday, the 5th of September, and Tuesday, the 6th of September, with the full Symposium then starting on Wednesday, the 7th of September. The Fellows/Early Career Course will again be led by Dr. Vivian Dimas and Dr. Darren Berman. It was very well received last year, and we are certain that the hands-on aspect will add a very valuable dimension. The course is intended for people in their last year of fellowship and the first two years following fellowship. People interested in attending should fill out the appropriate form, which they can get on the PICS website www.picsymposium.com/fellows_registration.html, and provide a letter of interest and a letter of support from their program director.

KS: We recently sat down with our allied health professional colleagues who talked a lot about the value of the nursing and tech breakout sessions. Can we expect such sessions again this year?

DK: Absolutely! They are an integral part of the work we do, and their sessions are always a very exciting part of the meeting. We definitely plan to have a breakout session geared towards our allied health professional colleagues.

KS: What about our industry partners. What sort of industry involvement can we look forward to?

DK: We expect to have a number of industry sponsored symposia where industry can showcase new technology and allow attendees the opportunity to learn about innovations in our field. This was something we received great feedback on last year and will certainly bring back again this year. The exhibit hall will also be a great chance for our participants to meet our industry partners, without whom this meeting wouldn't be possible.

KS: Since last year there was an announcement about a partnership between the PICS Society and the journal of Pediatric Cardiology, as well as other strategic partnerships. How is this going to be featured in the meeting this year?

DK: All members of the PICS Society will have free access to the journal of Pediatric Cardiology, which is now the official PICS Society journal. We'll also have our own section within the journal for interventional articles. All the abstracts from the meeting will be published in the journal as well!

I should note two additional partnerships that will be highlighted at this year's Symposium. Recently the PICS Society added a complimentary subscription to DocMatter as a free membership benefit--DocMatter is an online, global community by and for congenital heart disease interventionalists, which has become very active in sharing knowledge on a day-to-day basis.

Similarly, we are proud that *Congenital Cardiology Today (CCT)* is the official news and information source of the PICS Society. All PICS members receive a complimentary subscription to CCT.

Importantly, all three organizations--Pediatric Cardiology Journal, DocMatter and CCT--will have a major presence at the Symposium.

KS: For people reading this and looking forward to attending, how should they sign up?

DK: People can register for the meeting through our website www.picsymposium.com/. We encourage people to do so as soon as possible to make use of the early bird registration!

KS: Finally, are there any special events during the upcoming meeting that you would like to highlight?

DK: Yes, actually there is. We lost a dear friend and colleague recently, Dr. Kanishka Ratnayaka. His loss has been absolutely tragic, and we plan to honor him through a special recognition this year.

We will also have the scientific scholarship award and the travelling fellowship award; the latter being specifically created to help people from developing countries attend the meeting.

We're also planning to have a Latin session, as we do every year, to recognize our colleagues from Latin countries. That's always a very well attended and thoughtful session and we plan on having it again this year. Lastly, we will also have sessions on structural heart disease as well as sessions on adult Congenital Heart Disease.

KS: Thank you so much for your time! We look forward to attending what promises to be another wonderful meeting.

Pediatric Cardiologist Wichita, Kansas

The Ward Family Heart Center at Children's Mercy Kansas City seeks a candidate at the assistant or associate professor level who would join our team as a pediatric cardiologist based at the CMKC multi-specialty clinic in Wichita, KS. The successful candidate would join an existing group of 28 cardiologists (25 in Kansas City, 2 in Wichita, KS and 1 in Topeka, KS), 3 CV surgeons, 30 APNs. Our Wichita office consists of two cardiologists, an APRN and dedicated sonographers and nursing staff. The position has minimal inpatient duties but will require monthly travel to support our outreach clinics in central and western Kansas. Experience and interest in outpatient cardiology and echocardiography is a must. There are opportunities also for development of a Fetal Echocardiography program in the community if interested. Trainees in their final year are welcome to apply.

Candidates must be board-certified or board-eligible in Pediatric Cardiology. Strong communication skills are key. There are opportunities for teaching medical students and residents with faculty appointment at the University of Kansas School of Medicine – Wichita campus. Salary and academic rank are commensurate with experience.

Wichita is a prosperous, thriving community with a metropolitan population of 650,000, the largest city in Kansas. Located 180 miles southwest of Kansas City, the city is known for its central role in American aviation design and manufacturing. It is an affordable and very livable city of historic neighborhoods, highly-rated schools and several colleges and universities.

Our Heart Center serves a population of over 5 million in the heart of the U.S.A. We perform over 500 cardiac operations, 600 cardiac catheterizations including over 200 invasive EP procedures, 18,000 outpatient visits, and more than 20,000 echocardiograms annually. Our two state-of-the-art catheterization labs are both hybrid labs and equipped with the latest 3D imaging and EP technology. Telehealth is available and facilitates our outreach clinics. We have video-conferencing capabilities that are routinely used by providers from distant locations to dial into our conferences for patient care and education. In 2021, the Ward Family Heart Center program was ranked # 24 nationally by USNWR.

Our Kansas City-based super-specialty resources include Electrophysiology (which includes Clinical EP, pacing and Genetic Arrhythmia), Cardiac Transplantation/Heart Failure, Interventional Cardiology and Advanced Cardiac Imaging (fetal echo, 3D echo, trans-esophageal echo, CT, MRI and 3D printing). We also provide specialized, team-based care in Fetal Cardiology (with on-site delivery services for high-risk neonates in Kansas City), Interstage Monitoring (CHAMP), Preventive Cardiology, Cardiac Genetics, Cardio-oncology, Single Ventricle Survivorship, Pulmonary Hypertension, a dedicated POTS clinic and Cardiac Neurodevelopmental Services.

The successful applicant must share our unwavering commitment to excellence, integrity, collegiality, antiracism, and respect for inclusion of individuals with diverse backgrounds.

Please submit CV and cover letter to:

Or, for additional information please contact:

Stephen Kaine, MD

Interim Co-Director, The Ward Family Heart Center

Children's Mercy Kansas City

physicianjobs@cmh.edu

Children's Mercy Kansas City is an independent, non-profit, 390-bed pediatric health system, providing over half a million patient encounters each year for children from across the country. Children's Mercy is ranked by U.S. News & World Report in nine specialties. We have received Magnet® recognition five times for excellence in nursing services. In affiliation with the University of Missouri-Kansas City and the University of Kansas, our faculty of nearly 800 pediatric specialists and researchers are actively involved in clinical care, pediatric research and educating the next generation of pediatricians and pediatric subspecialists.

The Children's Mercy Research Institute (CMRI) integrates research and clinical care with nationally recognized expertise in genomic medicine, precision therapeutics, population health and health care innovation. In 2021, the CMRI moved into a nine story, 375,000 square foot space emphasizing a translational approach to research in which clinicians and researchers work together to accelerate the pace of discovery that enhances care. We invite you to visit Children's Mercy Hospital virtually at cmkc.link/PhysicianTour

For more information about Children's Mercy Kansas City and about Kansas City itself, visit cmkc.link/TakeYourPlace.

EEO Employer/Disabled/VET

500th Heart Transplant Performed at Children’s Hospital Colorado

The Heart Institute is one of only a few centers in U.S. to reach this milestone, reinforcing its position as the leader in the Rocky Mountain Region

The Heart Institute at Children’s Hospital Colorado (Children’s Colorado), <https://www.childrenscolorado.org/doctors-and-departments/departments/heart>, has performed its 500th pediatric heart transplant, a milestone that only a few centers across the country have reached. The new benchmark is a tribute to the many families who have entrusted Children’s Colorado with their care and the multidisciplinary team of caregivers who are committed to ensuring the best possible outcomes.

“From our first transplant patient more than 30 years ago to our 500th this year and every patient in between, the entire team at the Heart Institute has been honored to help so many families,” shared Melanie Everitt, MD, cardiologist and Medical Director of the Heart Transplant Program at Children’s Colorado. “This milestone speaks to the breadth and depth of our team’s experience, which allows us to treat the most complex cases that other hospitals may turn down, while still achieving excellent outcomes.”

According to national comparison data from the Scientific Registry of Transplant Recipients, the patient survival outcomes at the Heart Institute at Children’s Colorado after heart transplant are consistently better than the national average, and the hospital’s average time to heart transplant is lower.

1-year patient survival rate

- Children’s Colorado: 96%
- National: 91.37%

3-year patient survival rate

- Children’s Colorado: 95.83%
- National: 88.61%

Median time to heart transplant

- Children’s Colorado: 2.7 months
- Region: 5.0 months
- National: 5.5 months

“When pediatric hospitals began performing heart transplants in the 1980’s, the focus was solely on survival,” said Dr. Everitt. “But now, thanks to multidisciplinary teams such as the one at Children’s Hospital Colorado, the focus includes getting children back home and returning to normal childhood life as soon as possible.”

The Heart Institute’s multidisciplinary team focuses on more than a patient’s physical needs. The team--which includes not only pediatric and adult congenital cardiologists, cardiothoracic surgeons and interventionists, pulmonologists, pharmacists, transplant coordinators and cardiac care nurses, but also psychologists, dietitians, physical and occupational therapists, social workers, child life specialists and chaplains, attends to every aspect of their patient’s wellbeing, including their mental, emotional and spiritual needs.

“It is important to keep in mind that none of this would be possible without families who are willing to make this precious gift,” said Matt Stone, MD, cardiothoracic surgeon and surgical director of the pediatric heart transplant program at Children’s Colorado. “There is a very special donor at the center of every heart transplant, and we are thankful for each and every one.”

Children’s Hospital Colorado coordinates all of its heart transplant procedures with the help of Donor Alliance.

“Every patient we’ve served has meant the world to us, and we’re grateful for the opportunity to provide care to the children and families in our program,” said Dave Campbell, MD, cardiothoracic surgeon and former director of the pediatric heart transplant program.

Children’s Colorado is home to the only pediatric transplant center in the state and one of just a few in the entire Rocky Mountain

region. When the hospital’s pediatric patients reach adulthood, they transition to Children’s Hospital Colorado’s Adult Congenital Heart Disease Program, a joint program with UHealth University of Colorado Hospital, also located on the Anschutz Medical Campus.

About Children’s Hospital Colorado

Children’s Hospital Colorado is one of the nation’s leading and most expansive nonprofit pediatric healthcare systems with a mission to improve the health of children through patient care, education, research and advocacy. Founded in 1908 and recognized as a top 10 children’s hospital by U.S. News & World Report, Children’s Colorado has established itself as a pioneer in the discovery of innovative and groundbreaking treatments that are shaping the future of pediatric healthcare worldwide. Children’s Colorado offers a full spectrum of family-centered care at its urgent, emergency and specialty care locations throughout Colorado, including an academic medical center on the Anschutz Medical Campus in Aurora, hospitals in Colorado Springs, Highlands Ranch and Broomfield, and outreach clinics across the region. For more information, visit www.childrenscolorado.org or connect with us on Facebook, Twitter, Instagram and YouTube.

CONGENITAL HEART INTERNATIONAL PROFESSIONALS

CICU Medical Director - Pediatric Cardiac Intensivist, Associate Professor or Professor

The Division of Pediatric Cardiology and the Department of Pediatrics at LSU Health Sciences Center in New Orleans is accepting applications for a Cardiac Intensivist academic faculty position at the rank of Associate Professor or Professor (non-tenure, clinical track) to serve as Medical Director of the Cardiac Intensive Care Unit at Children’s Hospital New Orleans. Rank will be determined by the candidate’s credentials and experience.

As Medical Director for the Cardiac Intensive Care Unit, incumbent will work with the Heart Center Co-Directors to coordinate and integrate a team approach, unifying cardiovascular surgeons, intensivists, anesthesiologists, cardiologists, and advanced practice providers. Additional responsibilities include recruitment, training, and development of current and new CICU staff as well as fostering academic productivity and professional development of its faculty and

trainees and continue our participation in national registries such as the Pediatric Cardiac Critical Care Consortium (PC4).

Required: MD or equivalent, trained in pediatric intensive care and/or cardiology with an additional year of dedicated training in cardiac ICU, OR have a minimum of 5 years of CICU experience; BC/BE (or equivalent) in either Pediatric Cardiology or Pediatric Critical Care; licensed to practice medicine in the State of Louisiana before start date.

Please apply here:

<https://lsuhsc.peopleadmin.com/postings/10579>

**Contact: Thomas Kimball, MD
Chief of Pediatric Cardiology,
Co-Director of the Heart Center**

Pediatric Cardiac Intensivist, Assistant Professor or Associate Professor

The Division of Pediatric Cardiology and the Department of Pediatrics at LSU Health Sciences Center in New Orleans is accepting applications for an additional Cardiac Intensivist. This is an academic position and appointment will be at the rank of Assistant Professor or Associate Professor (non-tenure, clinical track) and will be determined by the candidate’s credentials and experience. The cardiac intensive care team will work in conjunction with pediatric cardiology, cardiothoracic surgery, and other subspecialists, in the management of cardiac patients.

The Heart Center has an ACGME-accredited LSUHSC pediatric cardiology fellowship training program. There are excellent opportunities for clinical, translational and basic research, particularly with the LSUHSC Cardiovascular Center of Excellence as well as the Heart Center’s Research Core. The successful candidate is expected to have strong clinical skills, have an interest in research, and participate in teaching of residents and fellows.

Minimum Qualifications: MD or equivalent; trained in pediatric intensive care and/or cardiology with an additional year of dedicated training in cardiac ICU, OR have a minimum of 5 years of CICU experience; BC/BE (or equivalent) in either Pediatric Cardiology or Pediatric Critical Care; licensed to practice medicine in the State of Louisiana before start date.

Pediatric Cardiologist (MRI)

The Department of Pediatrics, Section of Pediatric Cardiology at Tulane University School of Medicine in New Orleans, in partnership with the Children’s Hospital of New Orleans (CHNOLA), is seeking a full-time academic Pediatric Cardiologist with particular expertise in advanced non-invasive cardiac imaging in CT and MRI technologies to join our faculty group. The Heart Center team includes 22 physician member with expertise in non-invasive imaging, electrophysiology, cardiac intervention, adult congenital heart disease, pediatric coronary artery disease, heart failure and cardiac transplantation, pulmonary hypertension and fetal cardiology. The team includes three cardiac surgeons and five cardiac intensivists. The Heart Center is based at CHNOLA and includes not only Tulane faculty but also faculty in the LSU Health Sciences Center. The selected candidate must have demonstrated excellence in advanced non-invasive imaging involving CT and MRI modalities as well as echocardiography. Incumbent will be involvement in developing and leading a comprehensive state of the art cardiac CT and MRI program at CHNOLA.

The Department of Pediatrics at Tulane is committed to providing excellence in education, clinical care, and research. The selected candidate will become actively involved in all aspects of teaching including training medical students and residents.

As a University employed faculty member, you will receive a negotiable salary commensurate with experience, and a fully comprehensive benefits package, and relocation allowance. Academic appointment will be at the rank of Assistant, Associate or Full Professor determined by the candidate’s credentials and experience.

Coverage of ACC.22

Tricuspid Valve Repair with Edwards Pascal Transcatheter Repair System at One Year: CLASP TR

Kalkidan Bishu, MD, MS, FSCAI

Why is this study important?

Severe symptomatic tricuspid regurgitation (TR) is prevalent and causes significant morbidity. Surgical intervention is less commonly utilized, compared to left sided valve disease and there are questions regarding outcomes with surgical intervention in advanced stages. Thus, there is a need for a percutaneous intervention for native valve TR.

Should I change my practice because of these findings?

Edwards Pascal Transcatheter Repair System in the treatment of TR is investigational at this time.

What question was this study supposed to answer?

This prospective, single-arm multicenter early feasibility study was designed to evaluate the safety and performance of the PASCAL transcatheter valve repair system in symptomatic severe TR.

What did the study show?

Sixty-five patients (mean age 77; 55% women) with severe symptomatic TR despite medical therapy underwent treatment using Edwards Pascal Transcatheter Repair System. Primary endpoint was the composite of major adverse events at 30 days with follow

up at six months and then annually. One-year follow-up results were reported for 46 out of 65 patients in whom follow-up data was available (loss of follow-up attributed to Covid-19 pandemic). Mortality was 10.8%. Eighteen percent were hospitalized for heart failure and 16.9% experienced a major adverse event, the most common adverse event was bleeding at 9.2%. Eighty-six percent had TR that was moderate or less. Seventy-five percent had a two-grade reduction in TR severity. There was improvement in tricuspid annulus diameter, RV end diastolic diameter, RA volume, inferior vena cava diameter and TR jet area. Heart failure severity, six-minute walk test and quality of life were improved.

How good was the approach/methodology?

The one-year report of CLASP-TR extends the findings at 30 days regarding safety. It is limited due to the lack of follow-up in 19 out of 65 participants (29%). CLASP II TR is a prospective, multicenter, randomized controlled pivotal trial that is enrolling 825 participants and will provide more definitive answers regarding efficacy compared to medical therapy.

Clinical Impact of Residual Leaks Following Left Atrial Appendage Occlusion: Insights from the NCDR LAAO Registry

Andrew M. Goldsweig, MD, MSc, RPVI, FSCAI

Why is this study important?

This analysis of the National Cardiovascular Data Registry (NCDR) Left Atrial Appendage Occlusion (LAAO) Registry was the first study to show that peri-device leak is associated with increased stroke risk.

Should I change my practice because of these findings?

Because peri-device leak is associated with increased stroke risk, LAAO operators should assess devices carefully for leakage and strive to leave no leak.

What question was this study supposed to answer?

The study examined rates of a primary endpoint composite of stroke, transient ischemic attack, and systemic embolism among LAAO patients stratified by no leak, small leak (<5 mm), and large leak (>5 mm).

What did the study show?

Among 51,333 patients undergoing LAAO with the Watchman 2.5 device (Boston Scientific, Marlborough, MA) from 2016 through 2019, 37,696 (73.4%) had no leak, 13,258 (25.8%) had small leaks (<5 mm), and 379 (0.7%) had large leaks (>5 mm). The presence of a small leak was

associated with a slightly higher rate of the primary endpoint (adjusted HR 1.152, 95% confidence interval [CI] 1.025-1.294), major bleeding (HR 1.11, 95% CI 1.029-1.120), and any major adverse events (HR 1.102, 95% CI 1.048-1.160). Large leaks were not statistically associated with adverse events, although more patients with large leaks continued anticoagulation.

How good was the approach/methodology?

The NCDR LAAO Registry is the largest LAAO dataset in the world, including every commercial LAAO procedure performed in the US. However, the study was subject to the usual cadre of biases inherent when performing a retrospective analysis of a large data registry, particularly information bias.

Weill Cornell Medicine

New York-Presbyterian Kids

Komansky Children's Hospital

Pediatric Cardiologist

The Division of Pediatric Cardiology is seeking a Pediatric Cardiologist to join our team at New York-Presbyterian/Komansky Children's Hospital-Weill Cornell Medicine.

Candidates must be board certified or board eligible in Pediatric Cardiology. Experience in pediatric cardiac MRI is desirable but not mandatory, and suitable candidates would be offered the director position for pediatric cardiac MRI. Candidates wishing to pursue a physician scientist career with a strong research portfolio are encouraged to apply. Candidates must have excellent skills in non-invasive imaging, in particular transthoracic, transesophageal, and fetal echocardiography.

The successful candidate will be appointed under the Division of Pediatric Cardiology and will work predominantly at our main Upper East Side campus. In addition, the successful candidate may be covering our general and fetal outreach clinic in Lower Manhattan (presently 1 day a week).

The pediatric cardiac program at Weill Cornell Medicine is an integral part of New York-Presbyterian Hospital (NYP), which is one of the largest pediatric cardiac programs in the country and ranked 11th in the 2021 US News and World Report of best hospitals for Pediatric Cardiology & Heart Surgery. Our surgeons perform cardiac procedures at New York Presbyterian - Weill Cornell Medical Center, as well as Columbia University Medical Center.

Interested candidates please send CV to:

Ralf Holzer, MD, MSc

rjh3001@med.cornell.edu

Diversity is one of Weill Cornell Medicine's core values and is essential to achieving excellence in patient care, research, and education. We welcome applications from candidates who share our commitment to fostering a culture of fairness, equity, and belonging. Weill Cornell Medicine is an Equal Employment Opportunity Employer, providing equal employment opportunities to all qualified applicants without regard to race, sex, sexual orientation, gender identity, national origin, color, age, religion, protected veteran or disability status, or genetic information.

Pediatric Cardiac Interventionist Position

UC Davis Children's Hospital
School of Medicine
Department of Pediatric Cardiology

The Department of Pediatrics at the University of California, Davis School of Medicine is recruiting 1 full-time academic Pediatric Cardiac Interventionist within the Pediatric Cardiology specialty. We are recruiting at the Assistant/Associate/Full Professor level in the Clinical X or Health Science Clinical Series in the Section of Pediatric Cardiology, Department of Pediatrics and specifically trained and experienced in Pediatric Cardiac Interventions. Candidates must possess an M.D. or D.O. degree, be board certified in Pediatric Cardiology and must possess or be eligible for licensure in the State of California.

The interventional cardiology candidate must have at least 3 years of experience in interventions in congenital heart disease and have the desire and ability to build and grow a practice in interventional cardiology volume.

Work distribution will depend on the specific skillset of the candidate. It is expected that the candidate will share in the on-call and weekend/holiday coverage schedule.

In addition to the clinical responsibilities, the ideal candidate will be expected to participate in teaching of medical students, residents and fellows, research activities of the Department of Pediatrics, and serve on departmental committees.

The candidates must have the following qualifications:

- M.D. or D.O.
- Successful completion of an approved pediatric residency training program.
- Successful completion of an approved Pediatric Cardiology fellowship training program.
- Successful completion of a Pediatric Interventional Cardiology advanced fellowship training program.
- Board certification in Pediatric Cardiology.
- Eligibility for a California Medical License.
- Demonstrated proficiency in the teaching of students and housestaff.
- Demonstrated proficiency to perform clinical research.
- Ability to foster collegiality and work collaboratively in a diverse environment, including working closely with Adult Congenital Heart Disease services.
- Service including committees, leadership ability, and community outreach.
- Have Board Certification in Adult Congenital Heart Disease (preferred).

The Pediatric Heart Center at UC Davis Children's Hospital is inland Northern California's only full-service cardiac care facility for children and young adults, offering the latest tests and treatments for a range of congenital or acquired cardiovascular conditions. Our integrated multidisciplinary team of surgeons, specialists, physicians, nurses and researchers offer Northern California's most sophisticated specialized diagnostic, interventional and surgical expertise in comprehensive diagnostic, therapeutic, and surgical procedures for children with heart defects.

For full consideration applications should be received by December 27, 2021. However the position will remain open until filled. Completed applications include CV, Cover Letter, Statement of Contributions to Diversity, Equity, and Inclusion and contact information for 3-5 references.

Candidates should submit their application online at:

<https://recruit.ucdavis.edu/JPF04580>

The Cardiac Safety Research Consortium Announces Prospective Collection of Pediatric Cardiac Screening Data for the National Pediatric Cardiac Screening Data Warehouse to Inform Prevention of Sudden Cardiac Death in the Young and Pediatric Product Development

Multi-Stakeholder Project Aims to Improve Pediatric Cardiac Safety

The Cardiac Safety Research Consortium (CSRC) announced that the Prevention of Sudden Cardiac Death in the Young (SCDY) National Cardiac Screening Warehouse Pilot Study continues to advance with prospective screening data collection having started in 2021. The first-of-its-kind national pediatric cardiac screening data warehouse is being created through a collaboration with the U.S. Food and Drug Administration (FDA), Duke University and multiple public screening groups from across the country. Over 40,000 high quality digital electrocardiograms (ECGs) recorded during community screenings dating from 2015 to 2021 have been added to the warehouse. However, starting in May 2021, prospective data are being acquired which, in addition to the ECG, include screened individual's demographics (race, ethnicity, and other variables) as well as cardiac screening history and physical information. The national data warehouse may offer significant public health benefits not only in assessing SCDY risk in children, but also in establishing better guidelines for pre- and post-market cardiac safety evaluation, as well as the development of biomarkers for use in pediatric clinical trials. Currently the FDA uses an ECG data warehouse to support cardiac safety review in adults, but until now, there has been no equivalent for children.

"This warehouse has the potential to address two major unmet public health needs – identification of children at risk for SCDY and enhanced cardiac safety in pediatric drug development," said the project's principal investigator, Salim F. Idriss, MD, PhD, Executive Co-Director of the Duke Pediatric and Congenital Heart Center and Director of Pediatric Electrophysiology at Duke University Medical Center. "Thanks to the support of our industry and academic partners and especially our collaborating public screening groups, many of whom are parent-led foundations with limited funding, we have improved the

efficiency and quality of ECG data collection, leading to an unprecedented volume of reliable real-world data," he added. "We now have the ability to begin establishing pediatric ECG interpretation normal values based on sex, race, and ethnicity, in addition to the current values used for age, based on these data alone."

Data collection and data warehouse refinement is ongoing, and the next major step is the addition of collecting long-term data on individuals who had a cardiac screening. The CSRC pilot program will be rolling-out a feasibility study in early 2022 which enables recurrent electronic follow-up months after a screening to determine if a screened individual has a change in cardiac health status. Follow-up data are essential in determination of screening efficacy and establishment of screening best practices.

"The potential impact of this project demonstrates the power of multi-stakeholder teams working together to solve a problem facing the medical community," said Jonathan Seltzer, MD, MBA, FACC, executive director of the CSRC. "We're proud to be able to bring these groups together as part of our mission to improve cardiac safety and look forward to the possibility of future collaborations that will come out of this project."

The identification of children at risk for SCDY may allow for early initiation of medical interventions to reduce the risk. SCDY can occur in healthy-appearing children without symptoms. Since many of the diseases known to cause SCDY are genetic, the identification of children at risk may help in determining if other members of the family are also at risk.

Dedicated to protecting youth from SCDY, over ten community screening organizations from across the country are working as partners to help establish the national data warehouse. The

organizations were recruited through national project partner, Parent Heart Watch, whose prevention-driven initiatives include cultivating local champions who create community programs focused on the prevention of SCDY.

In addition to Parent Heart Watch, current partners include:

- Community screening organizations including: Championship Hearts Foundation (Texas), Cody Stephens Go Big or Go Home Memorial Foundation (Texas), Saving Hearts Foundation (California), Eric Paredes Save A Life Foundation (California), Screening America (South Dakota), Heart Screen New York (New York), Peyton Walker Foundation (Pennsylvania), Hearts for Athletes (Alabama), Thomas Smith Memorial Foundation (Michigan), Play for Jake Foundation (Indiana), Zac Mago Foundation (Indiana), Kyle J. Taylor Foundation (California)
- Academic leaders from Children's Hospital of Philadelphia, Lurie Children's Hospital, Baylor College of Medicine, St. Luke's Health System (Idaho and Oregon), and The Pediatric and Congenital Electrophysiology Society
- Industry partners including: AMPS LLC (Analyzing Medical Parameters for Solutions), AstraZeneca, Cardiac Insight Inc., Eli Lilly, and Clario (formerly ERT).

The study is ongoing, and anyone interested in supporting the initiative is encouraged to contact CSRC about how to get involved. "This project is a success because of the collaborative nature of the CSRC and could not have happened without our partnerships with the public groups. We would love to have others join in supporting to establish this important national public health resource," Dr. Idriss added.

Pediatric Heart Failure & Transplant Cardiologist Adult Congenital Heart Disease Cardiologist

Charlotte, North Carolina

The Congenital Heart Center at Levine Children's Hospital (LCH) seeks to recruit a **Pediatric Heart Failure and Transplant Cardiologist and Adult Congenital Heart Disease Cardiologist** to join their existing faculty.

- **Transplant candidates** will have completed an ACGME-accredited fellowship in pediatric cardiology and be BC/BE by the American Board of Pediatrics. A fourth year of additional training in pediatric heart failure and transplant, or a minimum of 5 years transplant experience is required. The candidate will rotate equally on Heart Transplant/Heart Failure Inpatient and Outpatient Services, as well as general cardiology inpatient and outpatient care with shared night/weekend call. Clinical expertise with mechanical circulatory support devices is required as this candidate will be considered to become the director of mechanical support, with responsibilities in patient care, administration, program development, safety and quality. The right candidate will have an opportunity to advance the strategic vision of the program as a whole, in addition to participating in clinical research and national committees. The Congenital Heart Center is an active participant in PHTS and ACTION. The candidate will join one heart failure cardiologist, three cardiac surgeons, three Advanced Practice Providers (APP), three transplant nurse coordinators, and a comprehensive allied healthcare provider team, to serve our cardiomyopathy, heart failure, and transplant population.
- **Adult Congenital Heart Disease (ACHD) candidates** will have completed an ACGME-accredited fellowship in pediatric cardiology or internal medicine, be BC/BE by the American Board of Pediatrics or American Board of Internal Medicine, and be ABIM board certified in Adult Congenital Heart Disease. Responsibilities will include both outpatient and inpatient general pediatric or adult cardiology, depending on primary board certification, and inpatient ACHD service. Our program is one of two in North Carolina with Adult Congenital Heart Association (ACHA) accreditation, including two ACHD board certified cardiologists, one APP, a nurse navigator, and a multidisciplinary care team. Call/weekend coverage on a rotating basis including ACHD call split with two other ACHD providers.
- Our Congenital Heart Team in Charlotte currently includes: 12 cardiologists, 3 congenital heart surgeons, 5 cardiac intensivists, 4 pediatric cardiac anesthesiologists, 2 pediatric cardiac radiologists, 20 APPs (includes 3 surgical APPs), 16 sonographers, 5 nurse navigators, and 9 dedicated RNs. Four additional cardiologists will be onboarding over the next 6 months as we continue to grow.

The **Levine Children's Congenital Heart Center**, established in 2010, is consistently ranked as one of the top-50 pediatric heart centers in the country by U.S. News and World Report. Our comprehensive congenital heart services include advanced cardiac imaging, dedicated cardiovascular intensive care staff, and regional referral programs in heart failure/transplantation, cardiac catheterization, electrophysiology, adult congenital heart disease, and fetal echocardiography. Surgical, cardiac catheterization, and electrophysiology volumes have more than doubled since 2010. The heart failure and transplant program has experienced exponential growth becoming the largest transplant center in the region for the past 5 years. We utilize all advanced mechanical support devices and have an active pediatric VAD program. Our state-of-the-art two lab cardiac catheterization and electrophysiology suite opened in February of 2017, with dedicated staffing and anesthesia teams. Our new outpatient office complex opened in December 2020, designed to treat all patients from fetal cardiology to ACHD. We have one of the most comprehensive Cardiac Neurodevelopment programs in the Southeast, providing a multitude of specialty services to our congenital heart patients in the same office suite. Participation in investigator initiated and multi-center industry sponsored studies is ongoing within the Heart Center, with the support of an active clinical research department. We remain closely aligned with our Atrium Health adult cardiology counterparts within the Sanger Heart & Vascular Institute.

Levine Children's Hospital (LCH) is a state-of-the-art facility in beautiful Charlotte, North Carolina, and the largest and most comprehensive children's hospital between Washington, DC, and Atlanta, GA. LCH has 11 floors and 234 inpatient beds, including a PICU and CVICU covered 24/7 by in-house intensivists, Progressive Care Unit, Inpatient Observation Unit, Pediatric Rehab Unit, and Pediatric Emergency Department. We are committed to being the region's leading provider of pediatric health care services.

LCH is a premier referral facility within Atrium Health (AH), one of the nation's leading and most innovative healthcare systems. AH operates nearly 2,500 system-employed physicians, more than 60,000 employees and more than 7,460 licensed beds across the Carolinas and beyond. In 2021, our health system joined with Wake Forest University, and integration of the congenital heart programs on both campuses is underway.

Charlotte is one of the nation's fastest-growing big cities and is projected to increase in population 71% by 2030. The area features world-class entertainment, eclectic culinary experiences, as well as an abundance of arts, musical, and cultural opportunities. There are numerous professional sports including the NFL Carolina Panthers, NBA Charlotte Hornets, MLS Charlotte FC soccer club, NASCAR, Carolina Knights baseball, Charlotte Checkers hockey and world-class training facilities at the US National Whitewater Center, as well as unlimited year-round recreational opportunities. Our students thrive in excellent public and private schools and numerous top ranked colleges and universities throughout the greater Charlotte region. Our location provides easy access to beautiful Blue Ridge mountains and some of the nation's most popular beaches. We are connected via easy airport access and convenient proximity to other major metropolitan areas.

Baby Receives World's First Combination Heart Transplant-Thymus Procedure

Using Processed Thymus Tissue from the Heart Donor Could Lower the Risk of Organ Rejection

Sarah Avery, Duke Health

A baby believed to be the first person to receive a combination heart transplant and allogeneic processed thymus tissue implantation appears to be gaining the immune cells necessary to reduce or eliminate the need for prolonged use of toxic anti-rejection drugs.

The two procedures -- performed at Duke University Hospital last summer under an expanded access application that was cleared by the FDA -- represent a milestone in heart transplantation.

"This has the potential to change the face of solid organ transplantation in the future," said Joseph W. Turek, MD, PhD, Duke's Chief of Pediatric Cardiac Surgery, and a member of the surgical team that performed the landmark procedure.

"If this approach proves successful -- and further validation is contemplated -- it would mean transplant recipients would not reject the donated organ and they would also not need to undergo treatment with long-term immune-suppression medications, which can be highly toxic, particularly to the kidneys," Turek said. "This concept of tolerance has always been the holy grail in transplantation, and we are now on the doorstep."

Currently, transplanted hearts have an average lifespan of about 10 to 15 years. With durability limited by the toxicity of immune-suppression drugs, other options have long been sought.

The idea of using donated and processed thymus tissue during heart transplantation has been under study at Duke and other sites for several years. Because the thymus gland stimulates the development of T-cells, which fight foreign substances in the body, implanting the processed tissue is hoped to establish the donor's immune system as the recipient's, so the donated heart is recognized as "self."

The approach has shown promise in animal experiments, including in Turek's lab at Duke, but it had previously not been tried in a living organ recipient.

Duke researchers received permission from the FDA for the investigational procedures after two important factors lined up serendipitously -- the youngster, Easton Sinnamon, needed both a heart transplant and processed thymus tissue implantation independent of one another, and he was a patient at Duke, where the processed thymus tissue implantation is solely available.

The processed thymus tissue implantation method, pioneered at Duke by Louise Markert, MD, uses a proprietary technique to culture and administer processed thymus tissue; the process has been licensed to Enzyvant Therapeutics GmbH. The company received FDA approval last fall for allogeneic processed thymus tissue-agdc, indicated for immune reconstitution in pediatric patients with congenital athymia, a rare condition in which children are born without a thymus. Enzyvant provided financial support for processing of the thymus tissue that was used in this research.

"We see tremendous promise in this technology for patients and we are working with urgency to advance research and development for all children in need of cardiac transplants," said Rachelle Jacques, Chief Executive Officer of Enzyvant.

For Easton, the first-in-human combination of procedures appears to be working. Tests taken 172 days post-transplant/implantation indicate the processed thymus tissue is functioning, building the critical T-cells that are integral to a well-functioning immune system. Easton's care team at Duke continues to monitor progress; another milestone is possible in several months when he could be tapered off anti-rejection drugs.

"Cases like this underscore how important new insights emerge when surgery and science are expertly practiced together," said Allan D. Kirk, MD, PhD, Chair of the Department of Surgery at Duke University School of Medicine. "This case has implications for more than just heart transplantation -- it could change the way that many solid organ transplants are done in the future."

Baby Easton is held by grandmother Julie O'Neal alongside mother Kaitlyn. This was Julie's first meeting with Easton.

"The team performed the transplant and implant in a patient who lacked significant thymus function, providing an excellent opportunity to examine how allogeneic processed thymus tissue can shape a person's immune system to be more receptive to a donor organ," Kirk said. "If this can be extrapolated to patients who already have a functioning thymus, it could potentially allow them to restructure their immune systems to accept transplanted organs with substantially less dependence on anti-rejection medication. The processing method used for the thymus tissue seems to be critical and is of great interest."

Born with severe heart defects as well as thymic deficiency from an unknown cause, which severely impaired his immune system, Easton received his transplant on August 6th, 2021, when he was 6-months-old, followed two weeks later with the implantation of the cultured thymus tissue from his heart donor. Easton recently celebrated his first birthday and continues to do well.

"It was one of those things where it could help him, and if it works, it not only helps him, but it could help thousands of other people as well with their children who need transplants," said Easton's mom, Kaitlyn. "When we talked about it, it was like 'Why would we not do it when we can make a difference for all these other people?'"

Director Pediatric Cardiology – Heart Failure/Transplant University of Minnesota, Minneapolis, MN

The Division of Pediatric Cardiology at the University of Minnesota is seeking a board-certified/eligible Pediatric Cardiology Physician at the Assistant, Associate or Professor rank as Director of the Heart Failure/Transplant program.

Opportunity Highlights:

- The Department / Division is seeking an individual with a strong interest in Pediatric Heart Failure, Mechanical Circulatory Devices and Pediatric Heart Transplant to lead our Heart Failure/Transplant program.
- Participate in pre- and post-transplant evaluation and treatment of cardiomyopathies and heart failure of different etiologies.
- Academic time protected to pursue scholarly work with a goal of developing collaborative or independent, research.
- The program has a long tradition in cardiac transplant and has recently recruited two surgeons with strong expertise in this field.
- This position will include general pediatric cardiology care in/at the award-winning [University of Minnesota Masonic Children's Hospital](#)

Division Highlights:

The Division of Pediatric Cardiology is comprised of 15 Pediatric Cardiologists dedicated to providing outstanding innovative pediatric heart care, education, and research. As the largest pediatric cardiology practice in Minnesota, our Heart Center utilizes a comprehensive team of CV intensivists, care coordinators, cardiologists, and surgeons—all within a true children's hospital setting, on a leading academic campus. We have two dedicated transplant coordinators and a well-established and growing solid organ transplant program.

Qualifications:

- BC/BE in Pediatric Cardiology and additional expertise in heart failure and transplant.
- New fellowship graduates will not be considered.
- Heart Failure/Transplant and VAD management experience desirable.
- Must have demonstrated involvement in clinical or basic science research through publications anticipated or published in peer-reviewed journals.
- Licensed or ability to obtain Minnesota Board of Medical Practice Licensure.

For more details about this opportunity or to apply, please contact Connie Franklin at cfrankli10@umphysicians.umn.edu

Equal Employment Opportunity

We welcome diversity in every area, from patient populations to our own physicians, and pride ourselves on being thoroughly inclusive. We gladly provide equal employment opportunities and do not discriminate on the basis of race, color, creed, religion, ancestry, sex, national origin, marital status, status with regard to public assistance, membership or activity in a local commission, disability, age, sexual orientation or veteran status.

Pediatric Cardiologist

The Department of Pediatrics at Southern Illinois University School of Medicine is recruiting an MD/DO for a fourth pediatric cardiologist position at the Assistant or Associate Professor level. Faculty will join a rapidly expanding cardiology program at our Children's Hospital, an 80-bed CHA affiliated pediatric referral center for Central and Southern Illinois with a referral base of almost 2 million. The current program includes state-of-the-art noninvasive imaging in TTE, TEE, fetal echocardiogram, and advanced MRI imaging. We have developed a highly successful collaborative clinical and research program with a nationally recognized pediatric cardiology center. Opportunities exist to participate in resident and medical student education and receive an advanced degree in medical education. Candidates must be board eligible in Pediatrics and Pediatric Cardiology. Illinois licensure is required prior to official start date. Travel in central Illinois to outreach clinics is required.

Applications are accepted online at:
